Project Title:

Student Result Anlayzer

Introduction

The Student Result Management System is a simple console-based application developed using 16-bit Assembly Language. The system is designed to take marks of three subjects, perform calculations, and display the final result including total marks, percentage, grade, and pass/fail status.

This project demonstrates how low-level programming can be used to perform arithmetic operations, handle input/output using interrupts, and implement decision-making logic.

Objective

The main objective of this project is to:

- Understand the basics of Assembly Language programming
- Learn how to handle input and output using DOS interrupts
- Perform arithmetic operations at a low level
- Implement conditional logic for grading and results
- Develop a simple and efficient result calculation system

Tools and Technologies

- NASM (Netwide Assembler)
- DOSBox Emulator
- 16-bit x86 Assembly Language
- INT 21h DOS Interrupts

System Overview

This program works in a step-by-step process:

The program starts execution in DOS environment.

The user is prompted to enter marks for three subjects:

- English

- Math
- Computer

The program reads and processes numeric input.

It calculates:

- Total Marks
- Percentage

Based on the percentage, a grade is assigned.

The system also determines whether the student has passed or failed.

Finally, all results are displayed on the screen.

Working Logic

Input Module

The system takes numeric input from the user digit by digit and converts it into a complete number using a custom input function.

Calculation Module

- $\text{Total Marks} = \text{English} + \text{Math} + \text{Computer}$
- $\text{Percentage} = \text{Total Marks} / 3$

Grading System

- $80 - 100 \rightarrow \text{Grade A}$
- $60 - 79 \rightarrow \text{Grade B}$
- $40 - 59 \rightarrow \text{Grade C}$
- $\text{Below } 40 \rightarrow \text{Grade F}$

Result Decision

- If $\text{Percentage} \geq 40 \rightarrow \text{Pass}$
- Otherwise $\rightarrow \text{Fail}$

Features of the System

- Accepts user input for multiple subjects
- Handles multi-digit number input
- Performs arithmetic operations (addition and division)
- Implements conditional branching for grading
- Displays formatted output using DOS interrupts
- Lightweight and fast execution

Implementation Details

The program is written in 16-bit Assembly Language and runs in DOSBox. It uses INT 21h services for input and output operations.

Key procedures include:

- Input procedure for reading numbers
- Calculation logic for total and percentage
- Print procedure for displaying numeric output
- Grade evaluation using CMP and conditional jumps

Conclusion

This project helped in understanding the fundamentals of Assembly Language programming. It provided practical knowledge of how low-level systems handle input/output, perform calculations, and make decisions.

Overall, the Student Result Management System is a simple but effective project that demonstrates core concepts of system-level programming.
